

Project Title

Understanding and Writing Organizational Policies

Choose 3 to 4 companies or organizations to review their policies. How do they differ and how might they be the same? Submit the names of the companies and which policies you reviewed.

Companies Selected:

Apple –

Chosen to sample policy design from a global technology company's perspective.

Coursera –

Selected for alignment with personal interest in education and edtech and how edtech policies may differ from consumer tech organization policies.

American Military University –

Reviewed my alumni organization's policies to provide example of policy documentation at the small to medium size campus area network level.

Policies Reviewed:

Apple – [Privacy Policy](#)

Apple have a comprehensive Privacy Policy prepared by some of the best legal and technical luminaries in the world. To streamline the expansive amount of information contained in Apple's Privacy Policy topics are organized and separated by topics like "Privacy Governance," "Apple ID and Family Sharing Disclosure," and others. As a global organization, Apple keeps policies in a multitude of languages available to the user and the option to select among languages is easily available when exploring topics. Selecting the "Privacy Policy" topic returns date/update information, relevant descriptive information, contact/policy download information, frequently asked question section, and global compliance certification. The Privacy Policy's information includes Apple's definition of personal data, user privacy rights, use of data, guidelines for sharing, transfer, and commitment to privacy. Overall, Apple's policy design is elegant, with minimalist layout and useful information. The Policy likely serves as a benchmark to many other organizations' privacy policies worldwide.

Coursera – [Terms of Use](#)

Like Apple, Coursera's Terms of Use Policy is elegant and structured with minimalist design principles. Sections are organized under bold text along with effective date information. Coursera's terms of use cover who may use their services and resolution methods available to Coursera in the event of misuse/violations. These policies protect both the user, who is informed

and able to participate with the terms, and Coursera, who can protect their materials from users who break the platform's rules or violate agreements. The Terms page then shows licensing information, content and learning material use terms, feedback gathering information, governance law and arbitration information, and general terms. These policies and policies like them help protect Coursera's and learner intellectual property, uphold academic integrity standards, and outline legal responsibilities for parties involved.

American Military University – [Technology Requirements Policy](#)

American Military University's Technology Requirements Policy is a well-designed and straightforward policy outlining basic hardware, system, and software requirements. The policy is intended to communicate the requirements for successful access to online learning resources and ensure functionality of course material and processes. Though the policy is essential for students it also applies to alumni, faculty, or any users of technology on the site.

Choose an example policy from SANS and create your own for the industry or organization that you are interested in.

By modifying the [Third-Party Management Policy template](#) provided by SANS I have been able to draft the following (ad-hoc) 'Third-Party Management Policy' that a small business called 'Example.xyz' could use as a policy framework. To begin, I downloaded the template hyperlinked above in a .docx format. By deleting the provide template header I was able to then put in place my own company's name 'Example.xyz.' Icons or image files could also be added here. I then changed the document font type to a style I preferred for my company, updated footer date information from 2025 → 2026, and edited last updated date to today's date. I then moved to each section, evaluating content and determining which is applicable to my company. Since my company is smaller in scope there are a few sections I modify including the scope (to reflect smaller scope), safeguards (for systems not currently in place), and policy sanctions (no current legal team) sections. Also, being a simple template there are many sections with generic language that could be changed to better reflect the brand (e.g. changing 'this organization' to 'Example.xyz'). The templates are an excellent tool but should be carefully reviewed and ideally audited by legal representation before extensive use.

Reflect on the experience and how you approached the problem.

Ordered Approach:

1. Reviewed lesson material to identify key aspects of policymaking for enterprise systems.
2. Identify that policies are created for contingency planning, risk management, protection of IP and adherence to law, and a range of other practical and essential purposes.

3. Identify three companies aligning with personal interest in technology and education (Apple, Coursera, American Military University).
4. Select three different policy types (privacy policy, terms of use policy, technology requirements policy).
5. Research chosen companies websites and relevant policy pages to meet assignment instructions.
6. Create a Word file and compose a structured document responding to questions raised in assignment discussions using selected resources.
7. Edit, review, and transpose Word document into our module's assignment text fields.
